

Data Types Quiz

Quiz 2 | 3 questions

Good job!

"False" is a String, not a boolean. Booleans are either True or False. Booleans don't have quotation marks around them, otherwise it would turn them into a String. So it should be `bool = False`

Question 1:

Which statement below is **incorrect**?

`932` is an Integer

`"False"` is a Boolean

`857.25` is a Float

`"523"` is a String

Good job!

Correct! Even though the underscore is there to make the large number more readable, because there is a decimal point it is still a Float. If you printed the number in your code, it would be stripped down to `734529.678`

Question 2:

What is the data type of the `mystery` variable?

```
mystery = 734_529.678
```

Integer

String

Qurtle

Float

Question 3:

I've put a spell on you. You are now a computer. If I give you the following code, what will you print out?

```
1 | street_name = "Abbey Road"
2 | print(street_name[4] + street_name[7])
```

☐ eR

☐

```
1 | "Abbey Road"
2 | "Abbey Road"
3 | "Abbey Road"
4 | "Abbey Road"
5 |
6 | "Abbey Road"
7 | "Abbey Road"
8 | "Abbey Road"
9 | "Abbey Road"
10 | "Abbey Road"
11 | "Abbey Road"
12 | "Abbey Road"
```
